Not : Within nine months from the publication of the mention of the grant of the European patent, any person may give notice to the European Patent Office of opposition to the European patent granted. Notice of opposition shall be filed in a written reasoned statement. It shall not be deemed to have been filed until the opposition fee has been paid (Art. 99(1) European patent convention).

## Description

This invention relates to mail handling machines, and in particular to mail handling machines for processing mixed mail including sealed and unsealed envelopes.

In U.S. Patent No. 1,799,820 (Keisen), published 1931, an envelope sealing machine is shown. However, this machine is designed for feeding, handling and moistening unsealed envelopes and not for handling sealed and unsealed close-flapped and open-flapped envelopes.

Co-pending European application, publication number 376,481 describes a mail machine for high speed processing of mixed mail, which includes unsealed as well as sealed envelopes. The mail flow in such a machine typically begins at a hopper where the incoming mail to be processed is stacked. The main flow path continues through a singulator, which separates individual mail pieces from the stack for serial processing. Following the singulator, the envelopes are caused to flow along the main path through a moistener which moistens the glue on the flaps of the unsealed envelopes and then seals the envelopes, and thereafter along the main path to a weigher and printer including a postage meter. The machine is intended to handle mixed mail, by which is meant unsealed envelopes with the flaps open in the position for moistening, unsealed envelopes with the flap closed and which has to be opened by the machine to the moistening position, and already-sealed envelopes.

In this environment, it is important to detect the presence of mis-sealed envelopes, that is, envelopes in which the sealed edge, instead of lying flat, may protrude outwardly or display other undesired anomalous leading edge states. If allowed to continue along the main flow path, such mis-sealed envelopes may jam the machine.

A mail handling machine having means for serially transporting along a main path sealed and unsealed close-flapped and open-flapped envelopes and means the main path for moistening the flaps of the unsealed envelopes, which machine includes means upstream of the moistening means for detecting mis-sealed envelopes. In one aspect of the invention, there is positioning in the main flow path of the mixed mail being processed a means for distinguishing between properly sealed, unsealed-with-flap-closed, unsealed-with-flap-open, and mis-sealed envelopes. It is one of the surprising results of this aspect of the invention that essentially mechanical means can be provided to perform this function.

In accordance with another aspect of the invention, the mis-sealed envelope detector is combined with a flap stripper, the device which moves the flap of an unsealed envelope from its closed to its

open position. By integrating the two functions, less space is used in the machine, and the overall length of the machine can be reduced.

In a preferred embodiment, a biased pivotable member is positioned in the main flow path. The pivotable member is shaped to perform the flap stripping function, and is biased so that it does not move during a normal flap stripping operation. However, the biasing is such that the pivotable member is forced out of the flow path by an oncoming mis-sealed envelope. This movement can be detected and used temporarily to slow the processing or to inform an operator that potentially jamming envelopes are in the main flow path and precautions should be taken.

In accordance with still another aspect of the invention, the mis-sealed envelope detector is associated with apparatus located downstream of the singulator but upstream of the moistener and which functions to position the flap of the unsealed envelopes at an orientation ready for the moistening operation. Thus, both the treatment of the unsealed and properly sealed envelopes and the detection of the mis-sealed envelopes take place at the same station. This conserves space and speeds up the processing.

A preferred embodiment of the invention will now be described in connection with the accompanying drawings, wherein:

Fig. 1a-1d are end view schematics of the different species of mixed mail required to be handled by the machine;  
 Fig. 2 is a perspective view of one form of the apparatus according to the invention, in relation to the downstream moistening module;  
 Fig. 3 is a perspective view from the top of the flap stripper and mis-sealed flap detector station of the invention shown in Fig. 2;  
 Fig. 4 is a cross-sectional view of the flap-stripping blade taken along the line 4-4 of Fig. 5;  
 Fig. 5 is a top view of the station illustrated in Fig. 3;  
 Fig. 6 is a side view from the front of the station illustrated in Fig. 3 during a flap-stripping operation;  
 Figs. 7-10 are perspective views showing operation of the mis-sealed flap detector when mis-sealed and properly sealed envelopes are driven past;  
 Fig. 11 lists an example of pseudocode for a programmable controller to handle the envelope flow through the flap detector station.

Fig. 1 schematically illustrates examples of mixed mail that the apparatus of the invention can handle. Fig. 1a depicts an unsealed envelope 10 whose flap 11 is open. In this position, water can be sprayed onto the flap glue line 12 and the flap subsequently sealed. Commonly-owned U.S. Pat-

ent No. 3,911,862 illustrates apparatus with this capability. In such a machine, typically the envelope is being transported across a deck 13 contacted by the bottom surface of the envelope, and along a registration side wall 15 contacted by the fold edge 16 of the envelope. The flap in this downward position typically rides in a slot 17 between the registration wall and the deck edge. The deck 13 and wall 15 have been shown spaced from the envelope for clarity.

Fig. 1b shows a properly sealed envelope 10, with the flap 11 glued down tight to the envelope body. In this case, the flap will contact the deck 13.

Fig. 1c shows a sealed envelope 10 that was improperly sealed, typically because the flap bulges as shown at 18.

Fig. 1d shows an unsealed envelope 10 with the flap in a closed position.

The machine processes the four kinds of mail shown differently. When the envelope in Fig. 1a comes through, a sensor detects the flap in the slot and primes the moistener to operate. The envelope in Fig. 1b should encounter no obstacles and pass through the moistener and sealer without being processed. The envelope in Fig. 1c will likely jam the machine modules downstream; therefore it must be detected and handled specially. The envelope in Fig. 1d must have its flap stripped open and pushed into the slot 17, so it appears as depicted in Fig. 1a and is processed the same way.

Fig. 2 shows the setting of the preferred example of this apparatus of the invention in the mail handling machine. Envelopes 10 are transported across a deck 13 by conventional transport means 20. The flap stripping takes place where indicated by 21. Thereafter the envelope continues along the machine deck where the profile of the open flap is taken to control a moistener 22 whose spray nozzle 23 is positioned under the deck 13, and the envelope then proceeds downstream to the sealer. The moistener and sealer only become activated when an envelope appears whose flap is located in the slot 17. Properly sealed envelopes flow right through stations 21 and 22 without interruption.

Fig. 3 shows in greater detail the construction of station 21, a key feature of which is a pivotably-mounted, airfoil-shaped blade 24 which has a wedge-like cross-section, depicted in Fig. 4. The blade 24 has a sharp front edge 25, flat top sections 26 in line with the deck 13, which optionally may be separated by cut-out areas 25, and an end 27 that curves downstream. The back side 28 is flat except for a downstream extension 29 which is used to support and position the blade 24.

The blade 24 has an upstream transverse arm extension 31 which is pivotably mounted 32 on the machine deck 13. The blade 24 can be made of

plastic or other material. Extending downward from and affixed to the blade is a magnet 33. A Hall-effect device 34 is mounted on the machine bed. A torsion spring 36 (Fig. 5) biases the blade 24 towards a closed position as shown in Fig. 3, in which magnet 33 is adjacent the Hall-effect detector 34. The latter acts as a sensor to detect position and/or movement of the blade 24. A biased finger 37 is mounted on the registration wall 15 and pushes the mail's flap edge, if unsealed, down toward the deck to pucker the flap from the envelope so that it may be stripped for moistening. A similar biased finger 38 also helps keep the envelope down against the deck 13 which continues downstream driven by the roller drive 39.

Fig. 5 illustrates the motion of the blade 24. In solid lines it is shown in its closed position, with magnet 33 in one of its two states. When hit by a mis-sealed envelope, the blade will rotate CW to the partially open position 24' shown in phantom, typically about 10°. However, an operator can manually rotate the blade about 90° CW to a completely open position where it is completely out of the mail path flow. In both the partially and completely open positions, the sensor 34 is switched to its opposite state.

The blade 24 profile is shaped such that when the unsealed envelope shown in Fig. 1d reaches this station, as illustrated in Fig. 6, the finger end 37 pushes down the envelope leading edge 40 as it crosses a gap 41 between a deck edge 42 and the front edge 25 of the blade. This action causes the flap 11 to separate or open wider, and it is forced under the angled bottom surface 44 on the blade, the main body of the envelope continuing over the top surface 26. The gap 41 opens (Fig. 5) to the slot 17 upstream, and the slot 17 downstream. The continued forward movement of the envelope 10, by the drive 45, therefore causes the flap 11 to follow the bottom surface 44 and is gradually forced into a generally vertical position and enters the downstream slot 17, positioned to undergo moistening. The curved shaped at the end 27 of the blade (Fig. 5) assists in achieving this desired flap position. The shaped structure 47 which is affixed to the deck just downstream of the blade 24 also assists in directing the flap into the slot 27, the flap passing under a curved wall 48 extending down from the structure 47. During this entire flap-stripping operation, the blade 24 remains in its closed position. The spring 36 tension is chosen so that the force required to strip open the flap does not exceed the spring tension. Thus, no signal is sent from the sensor 34 to the machine controller, depicted at 50.

Now, when a mis-sealed envelope as depicted in Fig. 1c comes along, as shown in Fig. 7, the bulge 18 which tends to open due to the pressure

25, which will try to strip open the flap 11. This is shown in Fig. 8. Since the latter is sealed, instead the spring tension is overcome and the arm starts to swing away as shown by the arrow. After about a 10° rotation, the sensor 34 will switch states and send a signal to the controller 50. While it is possible to substitute an electrical switch for the magnetic detector 34, the typical electrical switch will actuate as soon as the arm 24 begins to rotate. By using a magnetic switch, the sensor doesn't switch states until the magnet has moved at least a short distance away. This avoids undesired switch actions due to small movements of the blade 24 when no mis-sealed envelope is present.

Figs. 9 and 10 illustrate what happens when a properly sealed envelope as depicted in Fig. 1b comes along. In this case, no bulge is present and the sealed flapped edge as well as the envelope body pass smoothly over the top surface of the blade 24 without activating it. In other words, the blade 24 remains in its closed position.

When the sensor has been activated and sends a signal to the controller, several ways exist to handle the situation. The simplest is for the controller to stop the machine, and signal the operator that a mis-sealed envelope is encountered, in which case the operator would manually swing the blade 24 out of the way, and reach in and remove the mis-sealed envelope. Alternatively, when the mis-sealed envelope is intercepted by the blade 24 and becomes stuck, causing the blade to rotate and activating the sensor, the controller can be programmed to slow down the forward drives 45 for the envelope for several microseconds. If the bulge 18 is not too large, then the envelope can become unstuck and continue downstream, thus allowing the blade to swing CCW to its closed position, thereby informing the controller that the temporary jam has ended and allowing processing to continue. If the envelope can succeed in passing the structure 47, it is not likely to cause a jam downstream in the machine.

A preferred way of handling the situation when the stripper blade opens is by means of suitable programming of the micro controller 50. In particular, three possible events can occur: (1) the envelope passes straight through without budging the blade 24 which remains in its home or closed position; (2) the envelope has a small bulge which opens the blade 24 but the envelope doesn't get stuck and continues downstream in which case the spring-biased blade 24 returns to its closed position; this is acceptable; and (3) the envelope gets stuck on the blade and doesn't proceed downstream.

The microcontroller 50 which controls the drives as explained in the copending application (C.444) is readily programmed to handle intelli-

gently the three possibilities enumerated above. One suitable program in pseudocode is illustrated in Fig. 11, which will be best understood also with reference to Fig. 3. In the normal operation of the machine, assuming perfect envelope flow, the upstream envelope 10, before it reaches the flap stripping station 21 and while still under control of the takeaway nip of the singulator (the so-called post-nip position), is temporarily stopped or paused by the controller awaiting completion of the processing of the preceding downstream envelope. The program commences with an initial state designated CASE\_0, in which it waits for an envelope to reach the post-nip or pause position. Due to the dimensioning of the machine, when the envelope is in the post-nip position, the envelope's leading edge will have reached the blade 24. Two possibilities exist. The envelope edge has not budged the blade 24, or it has. Returning now to the program, when an envelope reaches the post-nip position, detected by a sensor, then the program flow drops down to state CASE\_1. If the blade has not moved, i.e., the blade 24 or arm as referred to in Fig. 11 is in its home or closed position, then everything is OK and the drives are activated to move the envelope to the next station 13, and program control drops through to CASE\_3.

While still in CASE\_1, if, on the other hand, the blade has budged and moved to its open position, then the ELSE statement tells the controller to activate the drives with a slower-than-normal velocity profile while starting a time (TIME-OUT) to count down from an assigned value X based on how long it should take for the blade 24 to return to its closed position if event (2) has occurred, a minor bulge that is acceptable and will allow the envelope to proceed downstream and undergo normal processing, rather than event (3). The reduced velocity, in effect, provides increased time to allow the machine to recover, if it can, from what may be only a temporary glitch, without a significant sacrifice in throughput. Program control then passes to CASE\_2 to distinguish these two events (2) and (3) wherein the counter state is tested. If it times-out and the blade 24 has not yet returned to its closed position, then event (3) is assumed, the controller shuts down the drives, the machine stops, and the user is informed of a jam and the steps to take to clear the jam, essentially to remove the stuck envelope. Otherwise, in the ELSE statement, if the blade 24 has returned before the counter timed out, then everything is OK, the envelope is now at the downstream station and control returns to CASE\_0.

Finally, CASE\_3 is provided to cover the possibility of a flap only sealed at the rear part of the envelope, but not at the front part. In this situation, while at state CASE\_1, the open part of the flap at

env lope, but not at the front part. In this situation, while at state CASE\_1, the open part of the flap at the front will not mov th blad 24, and as m ntioned above, the envelope is then advanced normally and control falls through to CASE\_3. If, then, the arm 24 is suddenly opened, because the rear sealed part of the flap catches the arm, then the machine is stopped and the user informed to take anti-jam action; otherwise, if the arm remains closed then everything is OK and control returns to the initial state CASE\_0.

It will be clear from the foregoing to those skilled in this art that other programs can readily be devised to perform the above-described functions of distinguishing the three events mentioned. Moreover, if desired, hard-wired logic circuitry can instead be provided to perform the same functions.

When the flap is stripped open into the downstream slot 17, it need not occupy a vertical position. Preferably the flap is forced up against an angled wall which houses the flap profiler in a position that allows the moistener underneath to spray the flap glue line.

By combining the flap-stripping and mis-sealed envelope detecting functions at a single station within the mail-handling machine, space is conserved and subsequent jamming of the machine is avoided. This allows the machine to handle a large variety of mixed mail, and to be operated at higher speeds to increase throughput of properly sealed envelopes.

Aims of the invention as particularly disclosed and illustrated herein are:- to provide apparatus for distinguishing between properly sealed and improperly or mis-sealed envelopes; to provide a mail handling machining for processing mixed mail and having for detecting and differently processing mis-sealed flapped envelopes; and to provide a mailing machine in which mixed mail is serially processed and provided with means for temporarily slowing mis-sealed mail and for taking special measures for handling such mis-sealed mail.

### Claims

1. A mail handling machine comprising means (20) for serially transporting along a main path sealed and unsealed close-flapped and open-flapped envelopes (10) and means (22) along the main path for moistening the flaps of the unsealed envelopes, which machine includes means (24) upstream of the moistening means for detecting mis-sealed envelopes.
2. The mail handling machine of claim 1 wherein the detecting means comprises movable means (24) positioned to be engaged and moved by the mis-sealed flap of a sealed

envelope, and means (33,34) responsiv to the moved movabl means for g nerating a signal indicative of the detection of a mis-sealed envelope.

3. The mail handling machine of claim 2 wherein the movable means comprises a shaped blade (24), pivotably mounted on the machine and located along the main path.
4. The mail handling machine of claim 3 wherein the blade is configured to strip open the flap of an oncoming envelope having a closed, unsealed flap.
5. The mail handling machine of claim 2 wherein the machine includes a controller (50), and the responsive means (33,34) is arranged to inform the controller, in use, that the envelope currently at the detecting means (24) is mis-sealed.
6. The mail handling machine of any preceding claim wherein the machine includes upstream of the detecting means (24) a finger (37) for pressing the flapped side of the envelope downward.
7. The mail handling machine of claim 3 wherein the blade has an air-foil shape as seen in plan with a forward edge (25) for engaging the envelope flap.
8. The mail handling machine of claim 7 wherein the blade has a flat top surface (26) over which the envelope body passes.
9. The mail handling machine of claim 3 wherein means (36) are provided to bias the shaped blade (24) toward a position where it extends substantially transverse to and in the main path.
10. The mail handling machine of claim 8 wherein the blade is mounted (at 32) for pivoting in a plane parallel to the envelope plane.
11. The mail handling machine of claim 9 wherein the blade is mounted for pivoting completely out of the main path for removing mis-sealed envelopes.
12. The mail handling machine of claim 6 wherein the machine includes a deck (13), the detecting means (24) has a top surface aligned with the top of the deck but spaced downstream from a deck edge to form a gap (41), and the finger (37) is positioned to bias the leading

- edge of an oncoming envelope (10) into the gap (41).
13. The mail handling machine of claim 12 wherein the deck has a slot (17) for receiving the open flap of an unsealed envelope, the slot (17) opens into the said gap (41), and the detecting means (24) is a blade-shaped body configured to force an open flap into the deck slot (17) downstream of the blade.
14. The mail handling machine of claim 5 wherein the machine includes a forward drive (45) for the envelopes, and in response to a signal from the responsive means (33,34), the controller (50) stops or slows the envelope forward drive.
15. The mail handling machine of claim 9 wherein the responsive means (33,34) comprises a magnetic sensor.
16. A method of processing mixed mail including sealed and unsealed flapped envelopes comprising:  
 (a) providing in the flow path of mail, means to intercept a possible mis-sealed envelope,  
 (b) advancing an envelope toward the intercept means,  
 (c) reducing the velocity of the advancing envelope when the intercept means detects a possible mis-sealed envelope,  
 (d) stopping the envelope if and when the intercept means has not generated a response within a predetermined time interval after the mis-sealed envelope was detected.
17. A method according to claim 16 in which the means to intercept is formed by an arm having a home position and configured and positioned while in that home position to intercept a closed but unsealed flap to strip open the flap and to intercept a possible mis-sealed envelope and be moved from its home position.
18. A method of processing mixed mail including sealed and unsealed flapped envelopes comprising:  
 (a) providing in the mail flow path an arm having a home position and configured and positioned while in that home position to intercept a closed but unsealed flap to strip open the flap and to intercept a possible mis-sealed envelope and be moved from its home position,  
 (b) advancing an envelope toward the movable arm, and
- 5      19. A method of processing mixed mail including sealed and unsealed flapped envelopes comprising:  
 (a) providing in the mail flow path an arm having a home position and configured and positioned while in that home position to intercept a closed but unsealed flap to strip open the flap and to intercept a possible mis-sealed envelope and be moved from its home position,  
 (b) advancing an envelope towards the movable arm,  
 (c) reducing the velocity of the advancing envelope to zero in response to movement of the arm from its home position.
- 10     20. A method as set forth in claim 17 wherein a timer is started when the arm moves, and if the arm has not returned to its home position when the timer times-out the envelope is stopped.
- 20     21. Postgut-Verarbeitungsmaschine umfassend eine Einrichtung (20), um entlang einem Hauptweg verschlossene und nicht verschlossene Briefumschläge (10) mit geschlossenem Briefverschluß und geöffnetem Briefverschluß seriell zu transportieren und eine Einrichtung (22) entlang dem Hauptweg, um die Briefverschlüsse der nicht verschlossenen Briefumschläge zu befeuchten, wobei die Maschine eine stromaufwärts der Befeuchtungseinrichtung angeordnete Einrichtung (24) einschließt, um falsch verschlossene Briefumschläge zu detektieren.
- 25     22. Postgut-Verarbeitungsmaschine nach Anspruch 1,  
 dadurch gekennzeichnet, daß die Detektoreinrichtung eine bewegbare Einrichtung (24) umfaßt, die positioniert ist, um von dem falsch verschlossenen Briefverschluß eines verschlossenen Briefumschlags ergriffen und bewegt zu werden, und eine Einrichtung (33, 34), die auf die bewegte bewegbare Einrichtung anspricht, um ein Signal zu erzeugen, das die Detektion eines falsch verschlossenen Umschlages anzeigen.
- 30     23. Postgut-Verarbeitungsmaschine nach Anspruch 2,  
 dadurch gekennzeichnet, daß die bewegbare
- 35     24. Postgut-Verarbeitungsmaschine nach Anspruch 1,  
 dadurch gekennzeichnet, daß die Einrichtung (20) einen Antrieb (45) umfaßt, der die Envelopen entlang des Hauptweges bewegen kann, und eine Einrichtung (33, 34), die auf die bewegte bewegbare Einrichtung (24) anspricht, um ein Signal zu erzeugen, das die Detektion eines falsch verschlossenen Umschlages anzeigen.
- 40     25. Postgut-Verarbeitungsmaschine nach Anspruch 1,  
 dadurch gekennzeichnet, daß die Einrichtung (20) einen Antrieb (45) umfaßt, der die Envelopen entlang des Hauptweges bewegen kann, und eine Einrichtung (33, 34), die auf die bewegte bewegbare Einrichtung (24) anspricht, um ein Signal zu erzeugen, das die Detektion eines falsch verschlossenen Umschlages anzeigen.
- 45     26. Postgut-Verarbeitungsmaschine nach Anspruch 1,  
 dadurch gekennzeichnet, daß die Einrichtung (20) einen Antrieb (45) umfaßt, der die Envelopen entlang des Hauptweges bewegen kann, und eine Einrichtung (33, 34), die auf die bewegte bewegbare Einrichtung (24) anspricht, um ein Signal zu erzeugen, das die Detektion eines falsch verschlossenen Umschlages anzeigen.
- 50     27. Postgut-Verarbeitungsmaschine nach Anspruch 1,  
 dadurch gekennzeichnet, daß die Einrichtung (20) einen Antrieb (45) umfaßt, der die Envelopen entlang des Hauptweges bewegen kann, und eine Einrichtung (33, 34), die auf die bewegte bewegbare Einrichtung (24) anspricht, um ein Signal zu erzeugen, das die Detektion eines falsch verschlossenen Umschlages anzeigen.
- 55     28. Postgut-Verarbeitungsmaschine nach Anspruch 1,  
 dadurch gekennzeichnet, daß die Einrichtung (20) einen Antrieb (45) umfaßt, der die Envelopen entlang des Hauptweges bewegen kann, und eine Einrichtung (33, 34), die auf die bewegte bewegbare Einrichtung (24) anspricht, um ein Signal zu erzeugen, das die Detektion eines falsch verschlossenen Umschlages anzeigen.

- Einrichtung ein geformtes Blatt (24) umfaßt, welches schwenkbar auf der Maschine angebracht ist und sich entlang des Hauptweges angeordnet ist.
4. Postgut-Verarbeitungsmaschine nach Anspruch 3,  
dadurch gekennzeichnet, daß das Blatt konfiguriert ist, um den Briefverschluß eines eintreffenden Briefumschlages mit einem geschlossenen, nicht verschlossenen Briefverschluß, in einen offenen Zustand abzustreifen.
5. Postgut-Verarbeitungsmaschine nach Anspruch 2,  
dadurch gekennzeichnet, daß die Maschine eine Steuereinrichtung (50) umfaßt und die entsprechende Einrichtung (33, 34) angeordnet ist, um die Steuereinrichtung bei der Verwendung darüber zu informieren, daß der sich gegenwärtig an der Detektiereinrichtung (24) befindliche Briefumschlag falsch verschlossen ist.
6. Postgut-Verarbeitungsmaschine nach einem der vorhergehenden Ansprüche,  
dadurch gekennzeichnet, daß die Maschine stromaufwärts von der Detektiereinrichtung (24) einen Finger (37) einschließt, um die umgeschlagene Seite des Briefumschlages nach unten zu drücken.
7. Postgut-Verarbeitungsmaschine nach Anspruch 3,  
dadurch gekennzeichnet, daß das Blatt in der Draufsicht eine flügelartige Gestalt, aufweist, mit einer Vorderkante (25), um den Briefverschluß des Briefumschlages zu erfassen.
8. Postgut-Verarbeitungsmaschine nach Anspruch 7,  
dadurch gekennzeichnet, daß das Blatt eine flache Oberfläche (26) aufweist, über die der Briefumschlagkörper läuft.
9. Postgut-Verarbeitungsmaschine nach Anspruch 3,  
dadurch gekennzeichnet, daß eine Einrichtung (36) vorgesehen ist, um das geformte Blatt (24) in Richtung einer Position vorzuspannen, in der es sich im wesentlichen transversal zu dem Hauptweg und in diesem hinein erstreckt.
10. Postgut-Verarbeitungsmaschine nach Anspruch 8,  
dadurch gekennzeichnet, daß das Blatt (bei 32) angebracht ist, um in einer Ebene parallel zu der Briefumschlagebene zu schwenken.
11. Postgut-Verarbeitungsmaschine nach Anspruch 9,  
dadurch gekennzeichnet, daß das Blatt angebracht ist, um zur Entfernung von falsch verschlossenen Briefumschlägen vollständig aus dem Hauptweg heraus zu schwenken.
12. Postgut-Verarbeitungsmaschine nach Anspruch 6,  
dadurch gekennzeichnet, daß die Maschine ein Deck (13) einschließt, die Detektiereinrichtung (24) eine Oberfläche aufweist, die zur Oberfläche des Decks ausgerichtet ist, aber von einer Deckkante stromabwärts beabstandet ist, um einen Spalt (41) zu bilden und der Finger (37) positioniert ist, um die führende Kante eines eintreffenden Briefumschlages (10) in den Spalt (41) zu drängen.
13. Postgut-Verarbeitungsmaschine nach Anspruch 12,  
dadurch gekennzeichnet, daß das Deck einen Schlitz (17) aufweist, um den offenen Briefverschluß eines nicht verschlossenen Briefumschlages zu empfangen, sich der Schlitz (17) in den Spalt (41) öffnet und die Detektiereinrichtung (24) einen blattförmigen Körper aufweist, der konfiguriert ist, um einen offenen Briefverschluß in den Deckschlitz (17) stromabwärts des Blattes zu drängen.
14. Postgut-Verarbeitungsmaschine nach Anspruch 5,  
dadurch gekennzeichnet, daß die Maschine einen Vorwärtsantrieb (45) für die Briefumschläge einschließt und die Steuereinrichtung (50) im Ansprechen auf ein Signal von der entsprechenden Einrichtung (33, 34) den Vorwärtsantrieb für Briefumschläge anhält oder verlangsamt.
15. Postgut-Verarbeitungsmaschine nach Anspruch 9,  
dadurch gekennzeichnet, daß die entsprechende Einrichtung (33, 34) einen Magnetsensor umfaßt.
16. Verfahren zur Verarbeitung von gemischtem Postgut, welches verschlossene und nicht verschlossene mit einem Briefverschluß versehene Briefumschläge einschließt, umfassend die folgenden Schritte:  
(a) Anordnen einer Einrichtung zum Abfangen eines möglicherweise falsch verschlossenen Umschlags in dem Flußweg des Postguts;

- (b) Weitertbewegen eines Briefumschlags in Richtung d r Abfangeinrichtung;  
 (c) Reduzieren der Geschwindigkeit des sich weiterbewegenden Briefumschlags, wenn die Abfangeinrichtung einen möglicherweise falsch verschlossenen Briefumschlag detektiert; und  
 (d) Anhalten des Briefumschlags, falls und wenn die Abfangeinrichtung eine Antwort nicht innerhalb eines vorgegebenen Zeitintervalls nach Detektion des falsch verschlossenen Briefumschlags erzeugt hat.
17. Verfahren nach Anspruch 16,  
 dadurch gekennzeichnet, daß die Einrichtung zum Abfangen durch einen Arm gebildet wird, der eine Ausgangs-Position aufweist und während der Ausgangs-Position konfiguriert und positioniert ist, um einen geschlossenen aber nicht verschlossenen Briefverschluß abfangen kann, um den Briefverschluß in einen offenen Zustand abzustreifen und einen möglicherweise falsch verschlossenen Briefumschlag abzufangen und aus seiner Ausgangs-Position herausbewegt zu werden.
18. Verfahren zur Verarbeitung von gemischem Postgut, welches verschlossene und nicht verschlossene Briefumschläge mit Briefverschlüssen einschließt, umfassend die folgenden Schritte:  
 (a) Anordnen eines Arms in dem Hauptflußweg, der eine Ausgangs-Position aufweist und in der Ausgangs-Position konfiguriert und positioniert ist, um einen geschlossen aber nicht verschlossenen Briefverschluß abzufangen, um den Briefverschluß in einen offenen Zustand abzustreifen und einen möglicherweise falsch verschlossenen Briefumschlag abzufangen und aus seiner Ausgangs-Position herausbewegt zu werden;  
 (b) Weiterbewegen eines Briefumschlags in Richtung des bewegbaren Armes; und  
 (c) Verkleinern der Geschwindigkeit des sich weiterbewegenden Briefumschlags im Ansprechen auf die Bewegung des Arms aus seiner Ausgangs-Position.
19. Verfahren zur Verarbeitung von gemischem Postgut, welches verschlossene und nicht verschlossene Briefumschläge mit Briefverschlüssen einschließt, umfassend die folgenden Schritte:  
 (a) Anordnen eines Arms in dem Hauptflußweg, der eine Ausgangs-Position aufweist und in der Ausgangs-Position konfiguriert und positioniert ist, um einen geschlossen aber nicht verschlossenen Briefverschluß abzufangen, um den Briefverschluß in einen offenen Zustand abzustreifen und einen möglicherweise falsch verschlossenen Briefumschlag abzufangen und aus seiner Ausgangs-Position herausbewegt zu werden;

- aber nicht verschlossenen Briefverschluß abzufangen, um den Briefverschluß in einen offenen Zustand abzustreifen und einen möglicherweise falsch verschlossenen Briefumschlag abzufangen und aus seiner Ausgangs-Position herausbewegt zu werden;  
 (b) Weiterbewegen eines Briefumschlags in Richtung des bewegbaren Armes; und  
 (c) Verkleinern der Geschwindigkeit des sich weiterbewegenden Briefumschlags auf Null im Ansprechen auf die Bewegung des Arms aus seiner Ausgangs-Position.
20. Verfahren nach Anspruch 17,  
 dadurch gekennzeichnet, daß ein Zeitgeber gestartet wird, wenn sich der Arm bewegt und der Briefumschlag gestoppt wird, falls der Arm nicht in seine Ausgangs-Position zurückgekehrt ist, wenn die Überwachungszeit des Zeitgebers abgelaufen ist.
- Revendications**
1. Une machine de traitement de courrier comprenant des moyens (20) pour transporter en série le long d'un trajet principal des enveloppes (10) cachetées et non cachetées avec pattes fermées et pattes ouvertes ainsi que des moyens (22) situés le long du trajet principal pour humidifier les pattes des enveloppes non cachetées, ladite machine comprenant des moyens (24) situés en amont des moyens d'humidification pour détecter des enveloppes mal cachetées.
  2. La machine de traitement de courrier selon la revendication 1, dans laquelle les moyens de détection comprennent des moyens mobiles (24) positionnés de façon à être sollicités et déplacés par la patte mal cachetée d'une enveloppe cachetée, et des moyens (33,34) réagissant aux moyens mobiles déplacés pour produire un signal indiquant la détection d'une enveloppe mal cachetée.
  3. La machine de traitement de courrier selon la revendication 2, dans laquelle les moyens mobiles comprennent une lame profilée (24) montée de façon pivotante sur la machine et située le long du trajet principal.
  4. La machine de traitement de courrier selon la revendication 3, dans laquelle la lame est configurée de façon à produire l'ouverture de la patte d'une enveloppe qui arrive et qui comporte une patte fermée et non cachetée.
